Total Transcriptome

Identify all RNA species, including partially degraded RNAs

Total transcriptomic sequencing is not restricted to messenger RNA, but involves sequencing of most RNA species, including long non-coding RNA (lncRNA). A ribosomal RNA (rRNA) depletion step is performed to remove the 18S and 28S ribosomal subunits that make up 60-90% of all RNA species present in your sample, allowing for deeper sequencing of your RNAs of interest.

This approach also tolerates the use of lower quality RNA (degraded RNA) for sequencing. Known causes for RNA degradation include FFPE-fixation and laser-capture methods. Our scientists have set up validated procedures to analyze these challenging samples. This includes clinical-grade sample isolation from FFPE material and tailored data-analysis.

Input material

Isolated Total RNA

Isolated Sample requirements

- Optimal total RNA amount: ≥ 250 ng / sample
- Validated input range from: 10-1000 ng
- Minimal volume of 20 μ l / sample
- Quality: RIN ≥ 3 (optimal >7) / RQN ≥ 3 (optimal >6)
- FFPE possible with a DV200 of 20% and ≥ 250 ng input

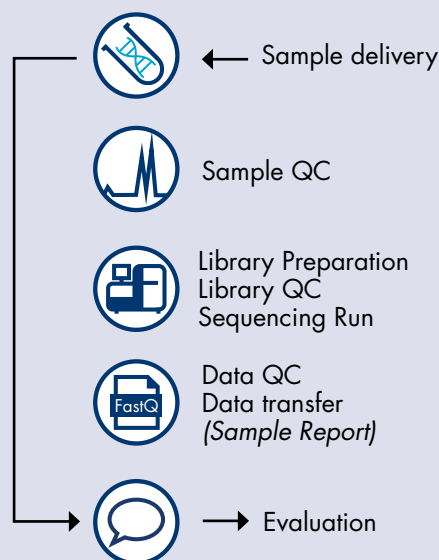

Sequencing on Illumina NovaSeq 6000 (PE 150)

- Standard read depth 30M / sample
- Removal of Globin RNA possible
- Unique Molecular Identifier tags

Deliverables

- FastQ files
- Quality score (Q30) $\geq 80\%$
- Optional data analysis with comprehensive report

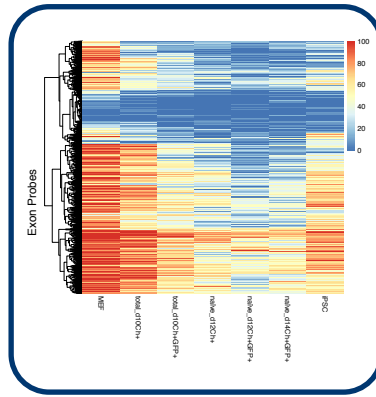

NGS Laboratory workflow

* Optimal input and quality (RIN >7) for RNA for high data quality: Data quality is dependent on sample quality, quantity and origin.

Principal components analysis

Heatmap

Pathway analysis

Committed to your project

Data quality guarantee

Depth of coverage, base quality and data quality are essential metrics to evaluate the quality of your NGS data. Our average score is generally Q30 \geq 90%.

Reads of unique transcripts

A known challenge of NGS sample prep is the formation of PCR duplicates (inversely related to the amount of sample input). Our RNA NGS service includes Unique Molecular Identifiers (UMIs) that ensure the ability to identify these PCR-artifacts and hence allow the read representation of truly unique transcripts.

Publication ready results

We have dedicated data-analysis pipelines to provide you with the output figures to best represent your data. For every option from microRNA's to long non-coding RNA's and from high-throughput screening methods to delicate single-cell sequencing.

Data analysis options

Our data analysis report provides multiple visualization options (see frame above) to make data easily comprehensible and useable for decision makers.

The report summarizes the most relevant information, with additional technical details in appendices or individual sample reports. It is based on many years of experience working with customers and a stringent quality system.

Robust industry-standard methods are used to determine gene expression levels and identify differentially expressed genes between biological conditions. Results can be viewed as summary table, individual gene lists, or heatmap.

Read mappings can be visualized using many intuitive graphical user interfaces that are available in the public domain. Multiple levels of quality controls ensure read integrity and biological plausibility of the results.

Biological Insights

- *de novo* transcriptome assembly
- Discovery of transcripts and variants
- Differential expression analysis of genes, transcript variants, and exons (alternative splicing)
- Analysis of gene fusions and trans-splicing events
- Gene regulatory networks, signaling pathways and networks, and gene enrichments
- Host/pathogen interactions or xenografts

Custom analysis

Custom bioinformatics can be performed allowing more in depth mining of your data set. Functional gene information mining, gene enrichment set, gene ontologies may be additionally provided when required.

About GenomeScan

As an ISO-accredited leading Dutch Next Generation Sequencing service provider, GenomeScan develops customizable NGS solutions for pharmaceutical and biotech companies, health care providers and academic institutions. By providing new tools to analyze genetic disorders quicker, affordably and effectively, GenomeScan fosters innovation through partnership with medical centers and research laboratories.
